The possibility of an early redemption has been neglected in the above table.

If all Underlyings always trade above the Knock-in Level during the lifetime of the product or if the Final Fixing Level of all Underlyings trades above the Initial Fixing Level, the redemption equals 100.00% of Denomination (USD 1'000). In these cases, the performance of the product corresponds to the sum of the guaranteed Coupons paid out during the lifetime: 12.5000%.

If the price of at least one Underlying trades at or below the Knock-in Level during the lifetime of the product and the Final Fixing Level of at least one Underlying trades below the Initial Fixing Level, refer to column "Knock-in Level touched", the performance equals the percentual difference between the Initial Fixing Level and the Final Fixing Level of the worst performing Underlying. This negative performance is reduced by the guaranteed Coupons paid out during the lifetime of the product. The Coupon Payment occurs independently of the level of the Underlyings on the respective Coupon Observation Date.

The redemption scenario above neglects early redemption. The table above is valid at maturity only and is by no means meant as a price indication for these derivative series throughout its lifetime. The price of these derivative series depends on additional risk factors between the Initial Fixing Date and the Final Fixing Date. The price quoted on the secondary market can therefore deviate substantially from the above table. It was assumed, that Adobe Systems s was the worst performing Underlying. This selection is just a representative example of the possible alternatives.
